Project Proposal HCI & IV

***Title**	Explaining Deep Learning image classification model results		
***Team no.**	#8	Name 1 Dian Visser	Name 2 Mateusz Wilk
Theme	Science & Education		
Visualization	(if known) JavaScript		
Platform	Python backend with the neural network training/importing and heat map of neuron activations calculation, visualized using matplotlib (for the prototype) and with JavaScript for the final product.		
Intended Users	Expert users with knowledge of AI systems such as other Informatics or DSAI students		
Research Question	How well does interactive visualization of a neural network classifier in a 3D space help understanding or explaining the classification result?		

Summary (approx. 200 words)

The application will visualize an image classification model's neuron activations through a heatmap using the field of Explainable AI as inspiration and motivation for research.
The model makes a classification on a single instance from the unknown test set and then the application displays it in a 3D space where the user can move around or focus specific parts using data transforms.

Optional: The use of an additional input device is also being considered, where the user can move around the 3D visualization space using hand gestures to aid the immersion. This will be decided based on the technical details of the tool, and whether it is easy to incorporate into the existing system.
